

$$DMG = ((ATK_{Base})(ATK_{\%}) + ATK_{flat}) \times (1 + DMG_{Bonus}) \times (1 + (CR) * (CD)) \quad (1)$$

$$\{CR, CD\} \longleftrightarrow \{100\%, (CR)(CD)\} \quad (2)$$

$$f(x, y, z) = (1000 \times (1 + 0.466 + 0.058x) + 311) \times (1 + (0.361 + 0.039y) \times (0.5 + 0.078z)) \quad (3)$$

$$38 = x + y + z \quad (4)$$

1. Define $g(x, y, z)$ by "moving" all terms of the constraint equation to one side. I.e. $g(x, y, z) = x + y + z - 38$

2. Define the Lagrangian function $\mathcal{L}(x, y, z, \lambda) = f(x, y, z) + \lambda g(x, y, z)$

$$\mathcal{L}(x, y, z, \lambda) = (1000 \times (1 + 0.466 + 0.058x) + 311) \times (1 + (0.361 + 0.039y) \times (0.5 + 0.078z)) + \lambda(x + y + z - 38)$$

3. Calculate the gradient of the Lagrangian $\nabla \mathcal{L}(x, y, z, \lambda) = \left(\frac{\partial \mathcal{L}}{\partial x}, \frac{\partial \mathcal{L}}{\partial y}, \frac{\partial \mathcal{L}}{\partial z}, \frac{\partial \mathcal{L}}{\partial \lambda} \right)$

$$conten \quad (5)$$

4. Construct a system of equations by setting $\nabla \mathcal{L}(x, y, z, \lambda) = 0$

$$\frac{\partial \mathcal{L}}{\partial x} = 0 \quad \frac{\partial \mathcal{L}}{\partial y} = 0 \quad \frac{\partial \mathcal{L}}{\partial z} = 0 \quad \frac{\partial \mathcal{L}}{\partial \lambda} = 0 \quad (6)$$
